Energy Charge: The RTP hourly energy prices are derived using the day ahead projection of Southern System Lambdas adjusted to recognize embedded costs. This price is determined as follows:

$$P = \lambda \times M + D$$

Where,

"P" = hourly price in ¢/kWh

"λ" = Southern Company territorial system Lambda, projected a day ahead for each hour of the day

"M" = multiplier which is used to adjust λ to recognize embedded costs

"D" = constant amount of 0.25¢/kWh added to each hourly price

"M" is determined as follows:

Generation and transmission embedded cost revenue requirements for Gulf Power's industrial customers are assigned to each of three periods, into which the year is divided<sup>1</sup>. The total revenue requirement for each period is then divided by the total relevant energy sales (kWh) for each respective period, to arrive at a total revenue requirement on a cents per kWh basis for each of the periods. For each period, this revenue requirement (cents/kWh) is divided by the average of projected hourly Southern System Lambdas for that period. The result is a Multiplier, "M", for each of the three periods. These multipliers will be reviewed periodically and adjusted as needed.

"D" is determined as follows:

Total embedded distribution revenue requirements for Gulf Power's industrial customers are divided by the total annual energy sales (kWh) to derive this cents per kilowatt-hour (kWh) constant for each hour of the year. These distribution costs were not included in the determination of the multiplier (M).

<sup>1</sup> Revenue requirements here would not include fuel costs, energy conservation costs, purchased power capacity costs, or environmental costs.
